

AgentFirewall

We make **spend-policy + signed-quote firewalls** for AI agents that pay for things over **x402**.

An agent's keypair signs whatever it's asked to.

x402 turned every HTTP endpoint into a payable surface. Agents now sign stablecoin payments at the speed of API calls — with **no spending limits** and **no way to verify the price** the seller actually committed to. Two weeks ago, a prompt-injected agent transferred **\$200,000** from a wallet on Base.

"my x402 wallet just autopaid for a vpn subscription i forgot i even had. it didn't flinch."

— @ClankerOnChain • May 7, 2026

"PaymentRequirements.amount is set unilaterally by the seller. A malicious endpoint can publish \$0.01 in the Bazaar and charge \$1.00 in the live 402."

— x402 architectural critique, Layer 1 #5

The blast radius is growing. 35M tx on Solana, \$600M annualized — and zero spending controls at the keypair layer.

AgentFirewall.

An **in-process proxy** that holds your agent's signing key and runs **two checks** on every payment — spend policy and Ed25519 quote-binding. Both must pass, or nothing signs.

LOCK 01 • SPEND POLICY

Per-call cap • daily budget • seller allow-list.

Stops Grok-style prompt-injection drains. Five named templates (paranoid → open). Daily budget rolls at UTC midnight.

LOCK 02 • QUOTE-BINDING

Ed25519 verify of seller-attested prices.

Fetches signed `.well-known/x402.json`, verifies signature, compares discovery price to live 402 price. Multi-facilitator.

The rails just got real. The brakes haven't shipped.

x402 went from launch to ~\$7B-valued ecosystem in nine months. The infrastructure to **drain** agent wallets is ahead of the infrastructure to **protect** them.

Bottom-up: \$238M ARR by 2028.

We monetize per-agent. Every wallet-enabled AI agent that pays over x402 is a potential \$19/mo seat.
The funnel below is conservative — Gartner projects machine customers will hit 20% of revenue by 2030.

\$238M ARR = 250K SOM × 4% conv × \$19/mo × 12 · plus enterprise tier (\$499/mo per agent fleet) and a cut on volume-based audits. **Today's beachhead:** ~3,000 builders shipping x402 agents on Solana. We need 100 of them on the paid plan to hit ramen profitability.

Five calls. Three blocks. One QUOTE_LIE caught.

Demo agent fires 5 calls through the firewall. Two pass. Three are blocked at the keypair, before any signature is produced. The signed-quote check is the centerpiece.

✓ **ALLOW** data-seller-a · \$0.0050 · sig 32vcQJVH...A1nRKi verified

✓ **ALLOW** data-seller-b · \$0.0080 · sig 52dfaJ2z...MxdZ1t verified

✗ **BLOCK** BUDGET_EXCEEDED
Per-call cap is \$0.0100 USDC, requested \$0.0500.

✗ **BLOCK** UNKNOWN_SELLER
Host evil.example.com not in allowedSellerHosts.

✗ **BLOCK** QUOTE_LIE
Seller's signed discovery price \$0.0100 ≠ live 402 price \$1.0000. Signature verified, mismatch detected.

The QUOTE_LIE moment: the malicious seller signed \$0.01 with a real Ed25519 key in their .well-known/x402.json, then quoted \$1.00 live. The signature proves the lie. Without quote-binding, a single agent call burns 100× the expected amount.

\$157K agent revenue, two weeks running.

My prior project **x402guard** is live on the aGDP.io leaderboard and ranked **#1 in Epoch 1** and **#2 in Epoch 2** by agent revenue — same x402-security wedge AgentFirewall productizes. AgentFirewall is the next layer on a stack already earning real money.

\$90.5K

x402guard · Epoch 1 revenue
#1 ranked agent · 11–23 Feb 2026 · \$67.2K total reward

\$66.6K

x402guard_pentester · Epoch 2
#2 ranked agent · 23 Feb–2 Mar 2026 · \$27.3K reward

\$184K

moonstack.fun accumulated
Founder Trading Tax + Released ACF + LP — Virtuals
Protocol launch

The signal: when this builder ships an agent in this exact wedge, it ranks top-2 on the public leaderboard within two epochs. AgentFirewall is v0.1 today on devnet — but this is not week zero from a builder track record. **x402guard proved demand. AgentFirewall productizes the policy layer.**

Freemium SaaS. No token.

Hobbyists run free. Teams pay per agent for multi-agent dashboards, custom tolerances, alerts, and audit logs. Enterprise pays per fleet for SSO + on-prem deployment + signed audit reports.

FREE \$0 forever · 1 agent ✓ Spend policy + quote-binding ✓ Default templates ✓ Open-source self-host ✓ Public Bazaar trust badge	PRO \$19 per agent / month ✓ Multi-agent dashboard ✓ Custom price tolerances ✓ Alerts (Discord · Slack · email) ✓ 30-day audit log + replay ✓ Hosted firewall (no self-host)	ENTERPRISE \$499+ per fleet / month ✓ Everything in Pro ✓ SSO + on-prem deploy ✓ Signed audit reports (compliance) ✓ Dedicated support + SLA ✓ Volume-based pricing on tx audits
--	---	---

Unit economics: \$19 ARPU/mo · ~\$2 hosting cost · ~80% gross margin. CAC target: \$40 (mostly content + integrations). **Payback ≈ 3 months.** No token, no inflation, no protocol fees – just SaaS for the agent commerce layer.

Why us.

goheesheng

SOLO FOUNDER • @BASE SG DEVREL AMBASSADOR • NTU

Product builder at the intersection of Web3, security, and UX. AgentFirewall is the third agent-payments project I've shipped in 2026 — each one tackles a different failure mode in the same emerging stack: identity, privacy, and now spend control.

- **x402guard** — **#1 agent on aGDP.io Epoch 1** (\$90.5K rev) • **#2 Epoch 2** as x402guard_pentester (\$66.6K rev) — same x402-security wedge AgentFirewall productizes
- **zx402** (formerly zBase) — first compliant ZK privacy layer for x402 payments + Morpho yield on Base • featured by [@virtuals_io](#) • [github.com/goheesheng/zx402](#)
- **moonstack.fun** — Virtuals Protocol launch • **\$183K accumulated** (CBBTC + USDC + VIRTUAL)
- Full-stack TS + Solidity + ZK: Bun, Hono, Next.js, web3.js, tweetnacl, Groth16/snarkjs, RainbowKit

Founder-problem fit: I've shipped privacy (zx402), an agent that earned **\$157K across two epochs** on the same x402-security wedge (x402guard), and now the productized policy layer (AgentFirewall). Same problem, three vectors. I'm not pivoting onto this — I've been here, and the public market has already priced in two of them.

\$250K SAFE, \$5M post-money cap.

Use of funds: 6 months runway · 1 part-time security engineer · ship v1.0 mainnet · 10 paid integrations · spec PR landed at x402-foundation/x402. **The bet:** the same builder who put x402guard at #1 on aGDP can put AgentFirewall on every agent shipping payments.

01 \$250K SAFE · \$5M cap · MFN

Tight enough to be founder-friendly, deep enough to ship v1.0 mainnet and reach 100 paid agents in 6 months.

02 10 design-partner intros

Named in slide 7 · pitches written · just need warm intros from the YC partner network.

03 Spec PR sponsorship

One YC partner co-signing the .well-known/x402.json signed-quote extension to x402-foundation/x402.
